

# From Persona to PRD: A Phased Discovery Blueprint for Building a Compliant Nigerian Real Estate Platform

## Defining the North Star: Persona Mapping and Journey Analysis

The initial and most critical phase of developing the buyer/renter pathway is the meticulous definition of the user. This process transcends generic audience segments to establish a concrete, empathetic understanding of the ideal customer, serving as the guiding principle for all subsequent design, development, and marketing efforts [43](#) . In the context of Nigeria's real estate market, which is projected to reach USD 40 billion by 2030 and is significantly driven by first-time home buyers, this step is paramount for creating a platform that resonates with local needs and builds essential trust [11](#) [12](#) . The objective of this discovery stage is not merely to identify who the users are, but to deeply understand their motivations, behaviors, emotional states, and potential pain points throughout their property search journey [10](#) [44](#) . This deep dive ensures that the resulting digital product is not a generic tool but a tailored solution designed to solve specific problems for a well-defined group of people. The output of this analysis is a comprehensive Persona & Journey Map document, which becomes the foundational artifact for the entire project, aligning stakeholders around a shared vision of the user [53](#) .

The persona creation process begins with synthesizing qualitative and quantitative data about the target market. For a real estate platform, this involves analyzing existing customer data, conducting user interviews, and researching market trends specific to Nigeria [9](#) . The goal is to distill this information into a composite profile of an archetypal user. An effective persona goes beyond basic demographics; it incorporates psychographics, such as values, attitudes, and lifestyle choices, and explicitly outlines their goals and frustrations related to property acquisition or rental [8](#) . For instance, an ideal persona for the buyer/renter pathway might be "Chinedu, 32, a tech professional." His profile would detail his desire for a 2-bedroom apartment in a specific neighborhood like Lekki, his preference for efficient, digital-first interactions, and his frustration with traditional methods like repeatedly calling agents about sold properties [36](#) . This level of

detail transforms an abstract user into a relatable individual with tangible needs. The persona document should also specify Chinedu's preferred channels of communication, his level of comfort with online transactions, and what he considers a "good" user experience, which in many emerging markets includes clear pricing, transparency, and strong security signals <sup>25 26</sup>. By grounding the project in this specific persona, the team can make informed decisions that prioritize features and design elements most likely to engage and convert him.

Following the creation of the persona, the next step is to map out the Customer Journey. This framework provides a structured way to visualize the user's entire experience, from initial awareness to post-engagement <sup>42</sup>. A journey map is more than just a linear sequence of steps; it documents the user's thoughts, emotions, and actions at each touchpoint, highlighting moments of delight and friction <sup>43</sup>. For the real estate buyer/renter pathway, the journey begins on the homepage, where the user encounters the Intent Gateway—a critical decision point asking whether they are here to buy, rent, or explore other options <sup>1</sup>. The journey continues through various stages: selecting an intent, navigating to the search portal, applying filters, viewing property listings, and ultimately, either finding a suitable property or encountering the "Not Found" scenario that triggers the concierge service <sup>10</sup>. At each stage, the journey map should capture the persona's potential emotional state. For example, the initial landing might evoke curiosity or skepticism, while applying filters could induce a sense of control and progress. The moment of finding a perfect match would bring satisfaction, whereas hitting a dead end after a thorough search could trigger frustration or resignation. Identifying these emotional high and low points is crucial because it allows the design team to strategically intervene. For example, the frustrating "Not Found" moment can be transformed into an opportunity to showcase the value of the premium concierge service, thereby converting a potential loss into a high-intent lead <sup>1</sup>. The journey map serves as a powerful communication tool, ensuring that all stakeholders—from product managers and designers to developers and marketers—share a common, empathetic understanding of the user's experience <sup>42</sup>. It forces the team to think beyond functionality and consider the human element, leading to a more intuitive and emotionally resonant product. This empathetic approach is particularly vital in complex regulatory ecosystems and infrastructurally challenged markets, where building trust is a key competitive advantage <sup>24 26</sup>.

# Architecting the Conversion Funnel: Logic and Conditional Flows

Once the user persona and journey have been clearly defined, the next critical task is to architect the conversion funnel with precision. This involves translating business objectives and user journey insights into a set of unambiguous, rule-based instructions that will govern the application's behavior. The primary goal is to create a seamless path that guides the user from initial interest to becoming a qualified lead, while strategically capturing valuable data at each step. A key strategic element highlighted in the project requirements is the "Not Found" fallback flow, which must be designed not as a dead end but as a pivotal conversion point <sup>1</sup>. This requires specifying the exact conditions under which this flow is triggered and the precise data it must collect to ensure the incoming lead is actionable by the sales team. The output of this architectural effort is a Funnel Logic Document, which acts as a technical specification for developers, leaving no room for interpretation and ensuring the final product executes the intended business strategy flawlessly <sup>53</sup>. This document details the logical pathways, conditional statements, and data-handling rules that form the backbone of the user experience.

The funnel logic must begin at the very first interaction: the Intent Gateway. This screen is the project's entry point and its logic must be absolute. A clear rule must be established: if the user selects "Buy" or "Rent," they are immediately routed to the / search page, with all other navigation options, such as those for landlords or builders, temporarily hidden or removed <sup>1</sup>. This clean segmentation prevents user confusion and focuses the experience from the outset. The core of the funnel is the search functionality. The logic for this must be specified in terms of database queries. For example, a query against the `properties` table should be defined with strict criteria: select records where the `status` column equals 'available', and where the `location` column contains the user's input text (e.g., using a case-insensitive pattern match), and where the `price` is less than or equal to the user's specified budget <sup>6</sup>. This level of detail ensures that the search results are accurate and relevant, directly addressing the user's primary need and reducing drop-off rates caused by poor search performance. Every filter applied by the user—such as number of bedrooms, property type, or amenities—must translate into a corresponding condition in this backend query logic.

The most sophisticated part of the funnel architecture lies in the conditional logic surrounding the "Not Found" scenario. This pivot point is where the platform transitions from a simple search tool to a proactive lead-generation engine. The logic must be programmed to check the outcome of the search query. A definitive rule must be written: IF the length of the returned `query_results` array is zero (`results.length ===`

0), THEN the standard "No results found" message must not be displayed <sup>1</sup>. Instead, the application must trigger a distinct UI flow, perhaps a modal dialog or a dedicated microsite page, that presents the "2-week concierge" service as a premium, exclusive solution. The copy for this offer is a critical component of this logic; it must frame the service as an upgrade rather than a compromise, using language like, "We couldn't find this exact match, but our Concierge Team can source it for you within 2 weeks. Unlock Off-Market Access" <sup>1</sup>. This reframing increases the perceived value and the user's willingness to provide their contact information. The form associated with this offer must be meticulously designed to capture all necessary data for lead qualification and processing. Furthermore, this event must trigger an internal Service Level Agreement (SLA). Upon submission of the concierge form, the backend system must create a new record in the `concierge_leads` table and automatically assign it a `priority` status of `'HIGH'` <sup>36</sup>. This high-priority tag must then activate an internal alert system, notifying the sales dashboard within minutes and requiring the sales team to acknowledge the lead within a strict two-hour window <sup>48 49</sup>. This automated SLA enforcement mechanism is crucial for maintaining the promise of rapid follow-up, which is often a key factor in converting real estate leads. By codifying these logical rules, the project moves from vague ideas to a concrete, executable plan.

## Building the Foundation: NDPR-Compliant Data Architecture and Schema Design

In the Nigerian digital landscape, where data protection regulations are increasingly stringent, embedding compliance into the core of the application architecture is not optional—it is a fundamental requirement for operational viability and user trust <sup>2 3</sup>. The Nigeria Data Protection Regulation (NDPR) mandates that organizations handling personal data adhere to principles of transparency, accountability, and fairness, with non-compliance carrying significant financial penalties <sup>5 14</sup>. Therefore, Phase 0 must include a dedicated effort to design a database schema and data processing logic that is compliant with NDPR from its inception. This involves more than just writing a privacy policy; it requires building mechanisms for explicit consent, data subject rights, and secure data handling directly into the PostgreSQL database and the custom backend APIs <sup>38</sup>. The primary deliverable for this component of Phase 0 is a 1:1 CRM Field Mapping table and an Entity-Relationship Diagram (ERD) that explicitly account for NDPR classifications and compliance controls <sup>53</sup>. This proactive approach ensures that every piece of user data collected through the buyer/renter pathway has a designated,

appropriately classified home in the database and that the system is built to respect and enforce the rights of data subjects.

The cornerstone of the GDPR-compliant architecture is the implementation of explicit, granular consent. The system must not assume consent; it must actively and demonstrably obtain it. This requires designing a dedicated `consent_logs` table within the PostgreSQL schema [4](#). When a user submits the concierge form, the backend must create a new record in this table alongside the lead's primary information. This record must capture several key pieces of evidence: a boolean flag indicating whether consent was given, a precise timestamp of when the consent was granted, the specific version of the Privacy Policy the user agreed to, and potentially the user's IP address at the time of submission [2](#). This creates an immutable audit trail that proves lawful basis for processing under GDPR. The frontend form itself must incorporate a checkbox labeled, "I consent to [Company Name] processing my data to find a property, as outlined in the Privacy Policy [Link to Policy]" [15](#). This checkbox must be unchecked by default, and the form submission process must be blocked if the user attempts to proceed without checking it. This simple yet critical validation rule is a direct architectural implementation of GDPR's principle of "privacy by design" [33](#).

Beyond consent, the architecture must support the full spectrum of data subject rights. This includes the right of access (the ability for a user to request their data) and the right to erasure (the "right to be forgotten") [38](#). To fulfill these rights, the backend must expose specific, secure API endpoints. An endpoint like `/api/user/data-export` would allow a user, upon providing authenticated proof of identity (e.g., email and phone number), to receive a downloadable file containing all personal data held on them [4](#). Conversely, a secure administrative endpoint, such as `/api/admin/user/hard-delete/{id}`, must be created to permanently anonymize or delete a user's Personally Identifiable Information (PII) from the database upon request [16](#). While PII is deleted, the system may retain anonymized data for statistical purposes, provided this is clearly stated in the privacy policy. Another critical aspect is data retention. The system must have a defined policy for how long different types of data are kept. For inactive concierge leads, for example, a scheduled job using PostgreSQL's `pg_cron` extension could be configured to automatically anonymize or archive these records after a set period, such as 24 months, to prevent unnecessary data storage [4](#). This automated data lifecycle management is a robust method for demonstrating ongoing compliance. The final component of this architectural foundation is data encryption. All sensitive data, both in transit (using TLS/SSL) and at rest within the PostgreSQL database, must be encrypted to protect against unauthorized access [24](#). The 1:1 Field Mapping table serves as the master reference, detailing for every single frontend form field the corresponding database

column, its data type, whether it is required, and its specific NDPR classification (e.g., Personal Data, Behavioral Data, Compliance Data) [53](#) . This table is the definitive guide for both the backend developer constructing the database schema and the frontend developer building the forms.

| Frontend Form Field | Backend DB Table & Column       | Data Type    | Required? | NDPR Classification | Business Purpose                     |
|---------------------|---------------------------------|--------------|-----------|---------------------|--------------------------------------|
| Full Name           | concierge_leads.full_name       | VARCHAR(100) | Yes       | Personal Data       | Agent personalization & follow-up    |
| Email Address       | concierge_leads.email           | VARCHAR(255) | Yes       | Personal Data       | Primary communication channel        |
| Phone Number        | concierge_leads.phone           | VARCHAR(20)  | Yes       | Personal Data       | Urgent SLA follow-up (WhatsApp/Call) |
| Desired Location    | concierge_leads.target_location | VARCHAR(100) | Yes       | Behavioral Data     | Search parameter for agent           |
| Max Budget (฿)      | concierge_leads.max_budget      | INTEGER      | Yes       | Behavioral Data     | Lead scoring & qualification         |
| Consent Checkbox    | consent_logs.is_consent_given   | BOOLEAN      | Yes       | Compliance Data     | NDPR lawful basis for processing     |
| Consent Timestamp   | consent_logs.consent_timestamp  | TIMESTAMP    | Yes       | Compliance Data     | NDPR audit trail                     |
| Policy Version      | consent_logs.policy_version     | VARCHAR(20)  | Yes       | Compliance Data     | Proof of which policy they agreed to |

This table exemplifies the level of detail required. It ensures that every data point collected is intentional, purpose-driven, and compliantly managed from the moment it enters the system.

## Formalizing the Blueprint: The Product Requirements Document and Sign-Off Protocol

The culmination of the discovery phase is the creation and formal approval of a single, authoritative document that crystallizes all findings, decisions, and technical specifications. This document is the Product Requirements Document (PRD), and its primary purpose is to serve as the project's "single source of truth," aligning all stakeholders—including business leadership, product, design, engineering, and legal—on the scope, goals, and functionality of the buyer/renter pathway [1](#) [53](#) . The PRD is the linchpin of a disciplined development process, acting as a contractual agreement that

prevents scope creep and misaligned expectations. Before any code is written or a pixel is placed, a rigorous sign-off protocol must be executed. This protocol, modeled on the Stage-Gate review methodology, establishes a formal "Gate 0" where senior leaders assess the completed discovery artifacts and grant official permission to proceed to the next phase of development [39](#) [46](#). This gate is a critical decision point for resource allocation and risk assessment, ensuring that the project only advances when the foundational work is complete, validated, and unanimously approved [40](#).

A well-crafted PRD is more than a wish list; it is a strategic and tactical blueprint. It synthesizes the outputs of the preceding discovery activities into a structured format. The document should begin with a clear problem statement and project overview, articulating the business goals and the value proposition of the platform [36](#). It must then detail the target user persona, referencing the Persona & Journey Map to explain the "who" and "why" behind the product. The core of the PRD is the functional requirements section, which translates the user journey and funnel logic into a series of specific, testable requirements. These should be written in a clear, unambiguous format, using the IF/THEN structure established during the funnel architecture phase. For example: "IF a user performs a search with no available results, THEN the system shall display the 'Concierge Offer' modal and block navigation away from it until the form is submitted or dismissed." Each requirement should be linked back to a specific business KPI, such as increasing the lead capture rate or improving the response time SLA [53](#). The PRD must also contain the detailed 1:1 CRM Field Mapping table, the NDPR Compliance Specification, and descriptions of the placeholder diagrams (Funnel Flowchart, ERD, Consent Logic Schematic) that visually represent the system's structure and logic [53](#). Including wireframes or mockups at this stage is beneficial for visual alignment, even if they are low-fidelity [37](#).

The sign-off protocol is the mechanism that gives the PRD its authority. This process must be inclusive and deliberate. The document should be circulated to all key stakeholders for review, with a specific deadline for feedback. The meeting to discuss the PRD and finalize sign-off should be attended by representatives from every relevant discipline: the business owner who initiated the project, the product owner responsible for the roadmap, the lead designer, the lead developer, and the legal/compliance officer [22](#). During this meeting, the product owner walks through the PRD, explaining the rationale behind key decisions and clarifying any ambiguities. The discussion should focus on three main areas: feasibility (can the engineering team build this?), fit (does this meet the business goals?), and compliance (does this satisfy legal obligations?). The ultimate goal is for every attendee to feel heard and for any major conflicts to be resolved before proceeding. The "Definition of Done" for this phase is not just a signed document, but a shared

understanding that the project's scope is now locked. The signature represents collective commitment to the plan laid out in the PRD. Any change requests that emerge after this point cannot be implemented in the current phase; they must be logged as a formal Change Request, evaluated for impact on timeline and budget, and approved through a separate governance process [20](#). This disciplined gatekeeping is the most effective defense against the common pitfalls of software projects, such as uncontrolled feature creep and divergent team expectations. The signed PRD becomes the permanent reference point for the project team, ensuring that development remains focused, aligned, and faithful to the original, rigorously vetted vision.

## Facilitating Alignment: The Role of Placeholder Diagrams and Handoff Protocols

While textual documents like the PRD are essential for conveying detailed requirements, they can sometimes fall short in communicating spatial relationships, system flows, and high-level concepts. To bridge this gap and ensure a truly shared understanding across diverse teams, the inclusion of placeholder diagrams in Phase 0 is not merely a suggestion but a critical component of the workflow. These diagrams, intentionally kept at a low-fidelity level, serve as powerful visual aids for discussion, brainstorming, and alignment [18](#) [19](#). Their purpose is not to be production-ready artwork but to act as a common language, enabling stakeholders from technical backgrounds (engineers) and non-technical backgrounds (business, legal) to collaboratively explore and validate the proposed architecture and user experience [37](#). Once the diagrams are finalized and approved as part of the Gate 0 sign-off, they provide a clear, visual blueprint for the UX/UI designers and backend architects, forming a crucial part of the handoff to the subsequent phases of development. This practice minimizes ambiguity and prevents costly rework by catching conceptual misunderstandings early in the process.

Three specific placeholder diagrams are indispensable for the buyer/renter pathway. First is the **Funnel Flowchart**. This diagram provides a bird's-eye view of the entire user journey, from the initial Intent Gateway through the search process and the critical pivot to the concierge fallback [45](#). It should use simple shapes—rectangles for steps, diamonds for decision points (e.g., "Are there search results?"), and arrows to indicate the flow. This visual representation makes the conditional logic, such as the "IF results.length === 0" rule, immediately apparent and easier to debate and refine than a paragraph of text. It helps the entire team, especially non-technical members, grasp the strategic

importance of the concierge flow as a conversion engine. Second is the **Entity-Relationship Diagram (ERD)**. This diagram visually maps the proposed PostgreSQL database schema, showing the tables (`users`, `properties`, `concierge_leads`, `consent_logs`) as boxes and the relationships between them as lines <sup>6</sup>. It is an invaluable tool for the backend team to confirm that the data model accurately reflects the business requirements and for the frontend team to understand the structure of the data they will be consuming via APIs. Finally, the **Consent Logic Schematic** provides a visual walkthrough of the NDPR compliance process. It would illustrate the user interacting with the consent checkbox on the form, the data being sent to the backend, and the simultaneous creation of records in both the `concierge_leads` and `consent_logs` tables. This diagram is particularly useful for the legal team to verify that the architectural design correctly implements the principle of explicit, auditable consent.

These diagrams are central to a robust handoff protocol that ensures a smooth transition from the discovery phase to the execution phases (design and development). The handoff cannot be a passive transfer of files; it must be an active, synchronous process. After the PRD and diagrams are signed off, a dedicated handoff meeting should be held involving the Product Owner, the UX/UI Designer, the Backend Lead, and the QA Lead <sup>20</sup>. During this meeting, the Product Owner reviews the approved artifacts, explaining the key decisions and answering any remaining questions. Following this, the UX/UI Designer and Backend Lead must perform a "Definition of Ready" check. They are asked to explicitly state whether they have all the necessary information to begin their respective tasks without blocking dependencies or unresolved questions. If either party identifies a blocker—for example, the designer needs clarification on the data format for a specific API endpoint—the issue is documented and addressed before the gate is closed. Only when both parties affirm that they are ready does the handoff conclude. At this point, the Backend Lead would create the initial Git repository and begin setting up the database schema based on the approved ERD, while the Product Owner uploads the final PRD to the project management tool (e.g., Jira or Linear) as the master source of truth <sup>53</sup>. This structured protocol transforms the handoff from a simple file transfer into a collaborative validation checkpoint, dramatically increasing the probability of a successful and efficient start to the development lifecycle.

# Executing Phase 0: A Structured Workflow and Governance Framework

The successful execution of the discovery phase hinges on a structured, sequential workflow governed by clear checkpoints and defined responsibilities. This framework, inspired by the Stage-Gate model, breaks down the complex task of product definition into manageable steps, each culminating in a tangible deliverable and a formal gate review [39](#) [41](#) . This methodology is designed to systematically de-risk the project by forcing critical decisions and validations at each stage, preventing the accumulation of assumptions and misalignments that can derail development. For the buyer/renter pathway, Phase 0 is composed of a series of interconnected steps, starting with deep user research and ending with a signed-off blueprint. Each step has a designated owner, produces a specific output, and is tied to a business-focused objective. This disciplined approach ensures that the project begins with a rock-solid foundation, minimizing ambiguity and maximizing the chances of delivering a product that meets both user needs and business goals.

The following table outlines the core steps of Phase 0, assigning roles, defining outputs, and linking each action to a primary business objective. This structure provides a clear roadmap for the project team and serves as a checklist to ensure all critical discovery activities are completed before moving forward.

| Step | Action                                                                                                                                   | Role Responsible                | Key Deliverables                                                  | Business/KPI Focus                                                                   |
|------|------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|-------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| 1    | Finalize detailed Buyer/Renter persona and map their end-to-end journey, including emotional touchpoints.                                | Product Owner + UX Researcher   | Persona & Journey Map Document <a href="#">8</a>                  | Align user experience with target user's mindset and pain points.                    |
| 2    | Define the complete conversion funnel, including all conditional logic (e.g., "Not Found" fallback) and Service Level Agreements (SLAs). | Product Owner + Backend Lead    | Funnel Logic Document <a href="#">36</a>                          | Ensure the funnel converts user intent into qualified leads efficiently.             |
| 3    | Design the internal PostgreSQL database schema and create a 1:1 mapping of every frontend form field to a database column.               | Backend Lead + Product Owner    | ERD + 1:1 CRM Field Mapping Table <a href="#">53</a>              | Guarantee data integrity, accuracy, and completeness for lead scoring.               |
| 4    | Translate NDPR requirements into system architecture, specifying consent capture, data subject rights, and retention policies.           | Legal/Compliance + Backend Lead | NDPR Compliance Specification <a href="#">2</a>                   | Achieve and maintain full regulatory compliance, eliminating legal risk.             |
| 5    | Synthesize all deliverables into a single Product Requirements Document (PRD) and secure formal sign-off from all stakeholders.          | Project Lead / Product Owner    | Signed PRD, Approved Diagrams, Gate 0 Approval <a href="#">53</a> | Establish a single source of truth to prevent scope creep and align the entire team. |

This structured workflow is reinforced by a clear handoff matrix that defines ownership and communication paths between phases. The Product Owner initiates the process by

owning the initial PRD draft, which is then refined by the UX/UI Designer and Backend Lead. Each phase concludes with a handoff to the next team, accompanied by a "Definition of Ready" confirmation to prevent blockers <sup>20</sup>. This governance framework transforms the discovery phase from an open-ended exploration into a predictable, controlled process. By mandating the creation of specific artifacts and enforcing a formal sign-off gate, it instills discipline and accountability. The emphasis on a self-contained, custom-built system further underscores the need for this rigor, as it eliminates the safety nets of pre-built SaaS solutions and places the onus entirely on the project team to get the foundational design right from the start <sup>36</sup>. Ultimately, this approach to Phase 0 is an investment in efficiency and quality. The time spent in this upfront discovery process pays dividends by drastically reducing the likelihood of costly rework, misaligned features, and project delays during the later, more expensive stages of design and development.
